Denmark

OIML Certificate No.
R76/2006-A-DK2-2022.05

OIML CERTIFICATE ISSUED UNDER SCHEME A

OIML Issuing Authority

Name: **FORCE Certification A/S**
Address: **Park Allé 345, 2605 Brøndby, Denmark**
Person responsible: **Per Rafn Crety**

Applicant

Name: **Marel Iceland ehf.**
Address: **Austurhraun 9
210 Gardabaer
Iceland**

Manufacturer **Marel Iceland ehf.**

Identification of the certified type (*the detailed characteristics will be defined in the additional pages*)

MU1

Designation of the module (*if applicable*)

Analog data processing unit

This OIML Certificate attests the conformity of the above identified type (represented by the sample(s) identified in the OIML type evaluation report) with the requirements of the following Recommendation of the International Organization of Legal Metrology (OIML):

OIML R 76-1, Edition (year): 2006

For accuracy class (if applicable): **III and IIII**

OIML Certificate No.
R76/2006-A-DK2-2022.05

This OIML Certificate relates only to metrological and technical characteristics of the type of measuring instrument covered by the relevant OIML Recommendation identified above.

This OIML Certificate does not bestow any form of legal international approval.

The conformity was established by the results of tests and examinations provided in the associated OIML reports:

Type examination report: No. 121-31618.10, dated 22 June 2022, that includes 68 pages

Type evaluation report: No. 121-31618.90.10, dated 06 July 2022, that includes 20 pages

The technical documentation relating to the identified type is contained in documentation file:
A530949 and 121-31618

OIML Certificate History

Revision No.	Date	Description of the modification
Initial version	26 August 2022	

Identification, signature and stamp

The OIML Issuing Authority

FORCE Certification A/S

Date: 26 August 2022

Jens Hovgård Jensen

Certification Manager

Important note: Apart from the mention of the Certificate's reference number and the name of the OIML Member State in which the Certificate is issued, partial quotation of the Certificate and of the associated OIML type evaluation report(s) is not permitted, although either may be reproduced in full.

Descriptive annex

The weighing module designated MU1 is an analog data processing device suitable to be incorporated in a non-automatic weighing instrument, class III or IIII, single-interval or multi-range.

The instrument is a class III or IIII, self-indicating weighing instrument with single-interval or dual-range. The MU1 analog data processing unit is powered from a PC by the USB connection (5 VDC).

Characteristics

Indicator type:	MU1
Accuracy class:	III and IIII
Weighing range:	Singe-interval, multi-range
Maximum number of verification scale intervals (n):	10,000 for class III, (for each range) 1000 for class IIII
Internal resolution:	±8388608 counts
Maximum tare effect:	-Max
Fractional factor:	$p'i = 0.5$
Excitation voltage:	±3 Vdc bipolar
Minimum input voltage:	0.25 μ V/e
Minimum dead load (D_{min}):	0 mV
Maximum analogue range	±30 mV
Circuit for remote sense	Active, (see below)
Minimum input impedance	85 ohm
Maximum input impedance	1100 ohm
Circuit for remote sense:	Active
Connecting cable to load cell(s):	6-wire system
Supply voltage:	5 VDC from USB
Operating temperature range	-10 °C/ +40 °C
Electromagnetic class:	E2
Max. cable length between MU1 and a junction box for load cells:	856 m/mm ²

Software

The software is split into two parts: a metrological and an operational.

The version formats are,

- Module metrology firmware: a.bb (a = functional change, bb = bugfix)

The approved version is 1.bb where bb=00 to 99.

- Module operation firmware: yymmdd (six digit date code)

The approved versions are 111220, 170131, 1903143, 191021 and 210206. Only 170131 and later versions support Marel Secure Printing.

The access control of MU1 can be configured to either Locked, Normal or Open.

In Locked mode the configuration and calibration data can only be modified if the sealable hardware button is pushed.

The two audit trail event counters CON and CAL will be incremented in any access control mode if the configuration data, respectively the calibration data, are changed. The event counters are non-resettable and increment up to 999.

The Open mode must not be used for legal applications.

In normal mode, access to the configuration and calibration facility is available via a password.

The identification of the MU1 firmware can be observed on command from the PC user interface to which the MU1 is connected via the USB interface.

Devices

- Initial zero setting device ($\leq 20\%$ of Max)
- Semi-automatic zero setting device ($\leq 4\%$ of Max)
- Zero tracking device ($\leq 4\%$ of Max)
- Semi-automatic subtractive tare balancing device
- Automatic tare device (can be disabled when unit is set for direct sale to the public)
- Preset tare device
- High resolution (protected by sealing)
- Gravity compensation device
- Internal alibi storage device
- Stable equilibrium, Zero and Net indicators.

Interfaces

USB – USB mini B connector. Cable must be double screened

Sealing or securing

The instrument can either be sealed or secured. In both cases one of the enclosure screws of the MU1 module shall be sealed with a brittle sticker.

Sealing

It is sealed by setting the access control in Locked mode and cover the push button of the MU1 module with a brittle plastic sticker.

Securing by event counters CAL and CON

The Instrument is secured by two event counters, CAL and CON, which are incremented each time the calibration or sealed configuration parameters are changed. The maximum count of both event counters is 999, starting from 001. The event counters can be read from the PC user interface to which the MU1 is connected via the USB interface.

At verification the value of the two event counters is written on a brittle plastic sticker - sealed with a verification mark - next to it.

If the value of the CAL or CON differs from the one written at verification time, the seal is broken.

The seal is placed on the outside of the enclosure containing the MU1 weighing module.

A complete MU1 NAWI instrument consists of a load receiver with strain gauge load cells, the MU1 module, and a general-purpose PC computer.

The MU1 module is a single chip microprocessor based unit, which runs on USB bus power and uses the USB bus to communicate with a PC computer. To be able to weigh, the MU1 module is also connected to a suitable load receptor. It can drive load receptors having up to four 350 Ohm strain gage load cells.

The MU1 user interface, controls, and primary indications are presented on the screen of the PC computer connected to the USB bus and running the user interface software.

The firmware in the MU1 module does all legally relevant signal processing, functions and error detection of a NAWI instrument. A stream of weighing data is sent over to the PC user interface software for displaying. The firmware will not stop sending data, even if an error has been detected. The PC user interface software will, however, act on error codes and stop presenting weight values on certain errors. It will also control annunciators like Stable and Net, based on codes received from the MU1 firmware.

The PC user interface software has the ability to authenticate the connection to a given MU1 module, and the MU1 module will only communicate with one instance of the PC user interface software at a time. The MU1 module does not communicate with a PC user interface it cannot authenticate. The authentication is based on a secret data known to both parties. On manual command, the PC user interface software has the ability to display the MU1 identification data.

There can be more than one MU1 module connected to each PC computer.

Because of different requirements, the look of the PC user interface can vary substantially, depending on the PC computer operating system and closed shell touch panel software requirements.

Example of stand alone MU1 PC user interface on a Windows computer

Example of MU1 PC user interface - Innova closed shell look
